1. What did you do to version/package your software/service.

   In order to package the software we used docker compose to create an image that contains all requirements and necessary files to run the server. In the future this will be used to deploy our service on AWS.

2. What version (e.g., 0.5.0) and type did you decide (e.g., API version or PKG version).

   0.1.0
   Due to our application needing to be fully production-ready, we have titled our version 0.1.0 as a beta.

3. A reference to where you published/released the artifact
   https://github.com/jgardner21/Elysium/releases/tag/0.1.0

4. We have only created the images we have not hosted our service on a publicly accessible endpoint yet as we have not begun the AWS portion of deployment yet. This will be done in the near future, we ran into bugs while composing our docker images that prevented us from further deployment steps.
